Import The Import command lets the user import a DXF or DWG file into a drawing. These commands can be used with AutoCAD, AutoCAD LT, and AutoCAD Architecture. The number of DWG files that can be imported at a time is limited to 10 and any files that are open in a drawing that are not part of the AutoCAD drawing can be counted towards the 10. A separate Import command in AutoCAD LT supports the importing of drawings stored in DGN, AIK and DXF format. The GUI, Command Line and RIBBON interface provide no import options. The CLI import is limited to a single image. The RIBBON can import several images but is limited to one from each image family. When a DXF or DWG is opened in the drawing, it replaces the existing drawing. Before saving, any objects that were created in the imported drawing will be replaced with the corresponding objects in the imported drawing. The imported drawing will not be associated with the existing drawing in the project tree. When importing a DWG or DXF file, a temporary file with the extension.dwg or.dxf is created in the AutoCAD directory. To avoid a file name conflict, the original filename and the created file name are stored in an EXPLOD file. When an import is cancelled or the user closes the file, the contents of the EXPLOD file will be removed. The import command is executed from the drawing's menu (or by pressing Enter or CTRL+S or CTRL+O). Export The Export command lets the user export a drawing to a DXF or DWG file. The file can be saved as a.dwg,.dwf or.dxf. AutoCAD LT also provides export functionality which exports drawings stored in DGN, AIK and DXF format to DXF and DWG format. When a DXF or DWG is opened in the drawing, it replaces the existing drawing. Before saving, any objects that were created in the imported drawing will be replaced with the corresponding objects in the imported drawing. File format conversions Conversions from file formats to AutoCAD file formats can be made with the Change Formats command. These commands are also available via the menu. Extract the BIN and EXE. Copy the "dc_and_globe.bin" and "dc_and_globe.exe" files to the location that you want them to be installed. Run "dc_and_globe.exe" to launch the Autocad application. Once the application has been opened, import the sample data (located in the folder \DC\Sample\Data) and save it. Now you are ready to create your own projects and export them as Autocad files to be opened later. When you finish with the projects, delete the sample data files. For further questions please visit the forum on Autodesk.com: In this case it is very easy, you just need to download the archive files for Autocad, there is a complete tutorial to do so with pictures in this website. If you need further help, just visit the Autodesk community. In case you want to use the same tutorial with another CAD software, just adjust the path names accordingly. A: Another thing I would suggest is creating a batch file that will automate the process and store it in a convenient location. It would be something like this

```
cd C:\Program Files (x86)\Autodesk\AutoCAD 2012\Acad.exe runas /user /save "C:\Documents and Settings\user\Desktop\Autodesk\AutoCAD 2012\Acad.exe" call C:\Documents and Settings\user\Desktop\Autodesk\AutoCAD 2012\dc_and_globe.exe
```

Then you'd just have to run this batch file whenever you wanted to start a new project. The runas command opens the file in a new window without a UI, and you can control the permissions of that window with the /save command. A: If you are looking for a way to create drawings in Autocad from autocad dxf then you can use "Reverse Engineer from DWG" which is available at this location. This will allow you to see the drawings and documents as an AutoCad drawing and you can edit them. As pointed
