The most significant change in Photoshop CS4 is its integration with the Adobe Creative Suite 4 Creative Cloud. Freed from the platform's constraints, Photoshop is free to grow and evolve, and to take on new constraints such as mobile graphics. If you've received a Photoshop CS4 file from a peer, chances are that you were able to open it in the latest version of Photoshop. The fact that it does not automatically update is a huge step in the right direction. From what I've seen, the latest version of Lightroom is a vast improvement over previous versions. Creative Cloud subscribers can now host a sky land or empty areas within a new Lightroom document, or inside an existing document, as either a new set of Layers or as a new Camera Raw Clip. You can then separate them with a simple gesture and retouch them by easily adjusting the white balance and so on. More importantly, a new Layers panel allows you to view this without having to scroll all the way to the bottom of the workspace. However, there are some minor annoyances. After working all night on a watercolor print, I made some changes to it. When I opened the image in the Layers panel, it would drop out in the middle of revising it, and would only show the first couple of lines of text. When I exited Lightroom, the panel would suddenly pop back, and everything I had done would be lost. I was back to the first version of the document. Lightroom 5.7 was released in late April of 2019 and includes a very useful tool for reference images. The "Reference Image Browser" displays a group of reference images based on the current master or based on a chosen size after you crop the image first. You can close it at anytime for a normal workspace experience.

Balanced Noise Reduction USES the technique known as Adaptive Histogram Equalization to reduce the visibility of objects, including distracting background elements. This feature works in the following ways: 1) Captures and displays high-frequency detail in the image and damps low-frequency detail to give the region of interest sharpness. Using its color, density and texture data, the USES sophisticated proprietary algorithms. 2) Creates a new histogram with a wider dynamic range. Applies new type of noise reduction algorithm over a new histogram with a wider dynamic range means that it does not change the median brightness of the highlights or shadows. As a result, the image will look less cluttered with a distinctive contours and tonal graduation. 3) Preserves all detail in the brightest and darkest areas. Similar to white areas and black areas as well. 4) Uses the Adaptive Histogram Equalization based on frequency. Provides a more accurate representation of the subject with a more accurate, processed image. The USES a sophisticated technique to break down the pixels into a frequency spectrum based on color, and frequency, then seeks to reduce noise at each level.
