The Hue and Saturation tool is the place to experience all the color adjustments in Adobe Photoshop. Here, you can tinker with a color's hue and saturation (aka, the brightness and contrast), and adjust the lightness or darkness of colors. Using this tool, you can adjust the color of your artwork without

changing the color of any other part of the image. You can also go one step further and use a eyedropper tool to find a color that is already in the image and select that for your adjustments. **What It Does:** The Adjustment Brush is perfect for creating fine-tuned adjustments that only affect a small part of the image. The Adjustment Brush is used to paint on an image, thereby selecting a specific area of the image by color. This is a great tool for specific adjustments, like replacing an old dress with a new one. **What It Does:** In the Raw area, you can actually edit images directly, before they are converted to the Adobe RGB color space, which is what much of the industry uses. Adobe Photoshop supports the web-standard sRGB color space. However, many digital cameras are also capable of shooting images in a RAW format. It is even possible to develop advanced RAW formats like Canon Digital Photo Professional (DPP) or Adobe Lightroom for Canon Digital Camera. **What It Does:** A Design workspace gives you access to panels that display several tabs at once: Brushes, Channels, Layers, and Paths. This is the main area in which you will do your art work and is where you can create and edit new layers. These can be moved to other panels, such as the Channels panel, for more powerful image adjustments. The Channels panel allows you to fine-tune the picture with different adjustments and select the parts of the image that you would like to apply the adjustments to. 933d7f57e6
